## **FAQ**

**What are the advantages of the Epilfree system compared with laser or infrared treatment?**

Treatment with the preparation offers higher efficiency compared to other treatments. The medical team of K.Y.P Cosmetic Technology claims prevention of hair regrowth for a long period of time with an efficacy of 80%.

Treatment with the preparation is suitable for all types of hair, including light hair.

This applies in particular to treatment of facial hair. Moreover, there is no risk of skin damage to which some people are prone as a result of optical depilation procedures and there is no limitation on exposure to the sun after treatment.

Treatment with the preparation does not require use of expensive equipment operated by a medical team, so it may be offered at a competitive price compared to other treatments. In

addition, one can become convinced of the efficacy of treatment individually by taking a single treatment without having to make a sizeable long-term financial commitment.

### **Does the treatment suit everybody?**

The treatment is intended for women as well as men and it may be carried out over any part of the body. Moreover, one can undergo a series of treatments also at a young age, relative to the competitive methods. The treatment is made possible because it inhibits hair re-growth and provides a substitute to hair removal with wax or any other epilator tool. For example, treatment with the preparation will bring down the required frequency of epilation treatments to a single treatment in each season.

### **I am a woman interested in removing facial hair. Can I be treated?**

The preparation can be used on all body parts. The preparation is safe and there is no danger of pigmentation or burn, as compared with other treatments.

I am a man and I have undergone treatment at the nape and shoulders. I see marked improvement but still no complete depilation. What can be done?

There are areas in a man's body and also in a woman's body in which hair growth is hormonally conditioned and therefore hair growth is repeatedly renewed. Treatment with the preparation thins out the hair and inhibits further hair growth. In order to reach full results, perhaps a larger number of treatments than the average will be needed. However, efficacy of treatment with the preparation is higher than that of treatment by other methods.

### **Is the product safe in use?**

The preparation received approval by Health authorities of the European common market. The lotion is manufactured at an approved cosmetic plant.

The preparation contains active ingredients and therefore pregnant and breast-feeding women should not use it. This limitation has been decided by the company as a precaution in order to refrain from use of the preparation in such cases. The preparation should not be used on irritated or damaged skin.

Use of the preparation does not involve any side-effects and it is safe for use. However, application should be stopped upon the appearance of signs of irritation, in which case, the user must consult a cosmetician. In most cases the appearance of a reddening, red spots or rash is due to the use of wax.
